```

```
-----------------------------------------------------------------------
-- Commentary (not executable proof): ties to DASHI contraction schema
-----------------------------------------------------------------------

-- The core takeaway for downstream modules:
--  * To recover ζ at nonpositive integers, it suffices to Abel-sum the
--    alternating Dirichlet series (contractive in q), then pass to the
--    Abel limit. The closed forms above give the constants needed in
--    operator-level arguments without appealing to divergent plain sums.
--
--  * This mirrors the p-adic / ultrametric fixed-point story used
--    elsewhere in DASHI: introduce a contraction that makes the series
--    convergent, extract the canonical limit, and treat that as the
--    invariant value of the “generalised sum.”
--
-- If a richer rational structure is added later, the Nat placeholders
-- here can be refined to actual ℚ witnesses with the same derivations.

-- Empirical learning (LHC harness): monotone descent holds strongly for
-- L1/MDL-proxy energies even when raw χ² is non-contractive. This matches
-- the intended geometry: Fejér/closest-point descent to a fixed set,
-- not global Euclidean contraction. Keep the seam here; do not assume
-- strict contraction in the raw metric.

DASHI.Physics.Closure.CanonicalProofSpine

```
module DASHI.Physics.Closure.CanonicalProofSpine where

-- Canonical proof-spine forwarding module.
-- This is the authoritative import path for the current physics closure route.
--
-- Assumptions:
-- - uses the concrete real stack instance and canonical bridge modules.
--
-- Output:
-- - one ordered record exposing the canonical route from real stack through
--   strong contraction/quadratic/signature/Clifford to minimal-credible and
--   known-limits bridges.
--
-- Classification:
-- - canonical

DASHI.Physics.Closure.PhysicsClosureSummary

```
module DASHI.Physics.Closure.PhysicsClosureSummary where

-- Repo-facing summary entrypoint.
-- Stage A current headline:
--   orbit profile signature discrimination in 4D.
-- Stage B current solved bridge for the finite 4D shift realization:
--   cone + arrow + isotropy
--   -> abstract shell action
--   -> shell-orbit enumeration
--   -> orbit profile
--   -> sig31.
-- Stage B canonical theorem seam:
--   intrinsic core axioms -> causal Lorentz forcing -> sig31.
-- Current intrinsic-core providers:
--   shift profile provider (canonical runtime path),
--   synthetic one-minus provider (alternate theorem-typed inhabitant).
-- Runtime selection plumbing:
--   full closure now has provider-parametric constructors,
--   minimal-credible closure now has a provider constructor with explicit
--   signature-match proof input (shift default, synthetic optional).
-- Stage B remaining open direction:
--   broaden derivations of intrinsic core axioms beyond the current
--   finite ternary signed-permutation realization stack.
-- Stage C long-horizon program:
--   full closure and downstream symmetry structure, documented in
--   Docs/ResearchRoadmap_A_to_C.md and not asserted as a current theorem.
-- Primary closure consumer:
--   PhysicsClosureFullInstance.
-- Legacy compatibility consumer:
--   PhysicsClosureInstanceAssumed.
-- Downstream physical consumer:
--   SpinDiracGateFromClosure.
-- Current validation snapshot:
--   self exact match,
--   synthetic one-minus admissible case exact match,
--   Bool inversion secondary admissible case signature-only match,
--   tail-permutation negative-control mismatch.
-- Current standalone B₄ report:
--   independent shell-orbit computation present,
--   shell neighborhood = definiteShellNeighborhood,
--   standalone series comparison present,
--   promotion status = standaloneOnly,
--   not yet promoted into the admissible rigidity harness.
-- Current shift shell neighborhood:
```

```
--   oneMinusShellNeighborhood.
-- Current independent Lorentz-neighborhood shell candidate:
--   synthetic one-minus shell family present,
--   shell-1 exact match against the shift reference,
--   shell-2 exact match against the shift reference,
--   shell comparison status = standaloneProfileOnly,
--   orientation/signature bridge now present,
--   promotion bridge = admissiblePromotionReady.
-- Current Lorentz-neighborhood dynamic candidate search:
--   synthetic admissible dynamics witness now present,
--   shell neighborhood fixed to oneMinusShellNeighborhood,
--   shell-2 structure present,
--   orientation/signature carried on the promoted synthetic path,
--   status = admissibleDynamicReady.
-- Current newest cycle widening status:
--   stronger parametric algebraic regime-coherence theorem,
--   recovered-wave-observables theorem,
--   wave-observable-facing downstream consumer,
--   and moonshine twined-wave-observable summary.
-- Current current-cycle widening status:
--   stronger parametric algebraic wave-observable-transport theorem,
--   recovered-wave-observable-transport theorem,
--   wave-observable-transport-facing downstream consumer,
--   and moonshine twined-wave-observable-transport summary.
-- Current one-minus family theorem status:
--   bounded family complete for `m = 2..8`,
--   parametric shell-1 theorem now exported on the shift reference path.
-- Current Fejér benchmark snapshot:
--   positive side established,
--   χ² side carried by a concrete shift-side boundary witness.
--   current χ² boundary library size = 3.
-- Current snap-threshold benchmark snapshot:
--   theorem-backed shift witness exported through the validation summary,
--   plus secondary and tertiary shift-side boundary cases beyond the
--   reference witness, plus synthetic one-minus, Bool inversion-specific,
--   and standalone `B₄` harnesses.
-- Current wave-series status:
--   concrete grade-0 prototype only,
--   not on the theorem-critical closure path.
-- Current moonshine-facing prototype status:
--   finite graded shell series present for shift and standalone `B₄`,
--   finite twined fixed-point traces present for shift and standalone `B₄`,
--   wave-graded shell adapter present as a prototype-only grading bridge,
--   no modularity, umbral, or Monster claim yet.
-- Current Stage C widening status:
--   carrier-parametric gauge/constraint theorem now has a second realized
```

```
--   carrier instance,
--   local known-limits widening now includes a geometry-transport theorem,
--   canonical theorem bundle now aggregates the full current runway ladder.
-- The theorem surface is now intrinsic-core-parametric; current canonical
-- inhabitants are still provided by the finite 4D realization framework.
-- Current closure hardening status:
--   the canonical full closure and empirical full adapter now share the same
--   concrete constraint-closure witness, and the legacy assumed closure
--   instance now uses that same concrete witness too; assumption-backed
--   geometry/prototype modules still remain outside the canonical Stage C path.
-- Current canonical Stage C status surface:
--   `CanonicalStageC` is the authoritative closure entrypoint,
--   canonical path status = canonicalProved,
--   canonical dynamics status now exported explicitly,
--   canonical dynamics witness now exported explicitly,
--   canonical constraint-closure status now exported explicitly,
--   canonical known-limits status now exported explicitly,
--   canonical known-limits recovery witness now exported explicitly,
--   canonical gauge/constraint bridge theorem now exported explicitly,
--   canonical constraint/gauge package now exported explicitly,
--   canonical parametric gauge/constraint theorem now exported explicitly,
--   canonical realized gauge-instance report now exported explicitly,
--   canonical propagation/spin theorem now exported explicitly,
--   canonical known-limits recovery package now exported explicitly,
--   canonical local causal/effective propagation theorem now exported
--   explicitly,
--   canonical local causal-geometry coherence theorem now exported
--   explicitly,
--   canonical spin/Dirac consumer now depends on the stronger witness-bearing
--   Stage C surface rather than only the forced metric seam,
--   canonical contraction-forces-quadratic theorem now exported explicitly,
--   canonical signature-forcing invariant now part of the Stage C path,
--   legacy wrappers are compatibility-only,
--   wave-series / unification surfaces remain prototype-only.
-- Current pre-moonshine hardening status:
--   richer twiner libraries are now landed for shift and standalone `B₄`,
--   a detailed graded/twined comparison report is now exported,
--   a stronger wave-graded shell prototype summary is now exported,
--   the track remains explicitly finite, Weyl/theta-like, and non-modular.
-- Current broader widening status:
--   a stronger parametric algebraic-closure theorem is now exported on the
--   canonical gauge package layer,
--   a broader extended local recovery theorem is now exported on the
--   canonical known-limits side,
--   a propagation-facing canonical consumer is now exported on the
--   authoritative Stage C ladder.
```

```
-- Current newest widening status:
--   a stronger parametric algebraic-coherence theorem is now exported on the
--   canonical gauge package layer,
--   and a local physics-coherence theorem is now exported above the current
--   extended local recovery slice.
-- Current latest widening status:
--   a stronger parametric algebraic-stability theorem is now exported above
--   the current algebraic-coherence layer,
--   and a recovered-local-regime theorem is now exported above the current
--   local physics-coherence layer.
-- Current newest widening status:
--   a stronger parametric algebraic-closure bundle theorem is now exported
--   above the current algebraic-stability layer,
--   and a complete-local-regime theorem is now exported above the current
--   recovered-local-regime layer.
-- Current next-cycle widening status:
--   a stronger parametric algebraic persistence theorem is now exported
--   above the current admissibility-transport layer,
--   a recovered-observable-geometry theorem is now exported above the current
--   recovered-observables layer,
--   a regime-facing downstream consumer is now exported on the canonical
--   ladder,
--   and a richer moonshine orbit-trace summary is now exported on the
--   parallel finite graded/twined track.
-- Current newest cycle widening status:
--   a stronger parametric algebraic gauge-sector persistence theorem is now
--   exported above the current algebraic persistence layer,
--   a recovered-transport-consistency theorem is now exported above the
--   current recovered-observable-geometry layer,
--   a recovery-transport consumer is now exported on the canonical ladder,
--   and a moonshine wave-trace consistency summary is now exported on the
--   parallel finite graded/twined track.
-- Current next-cycle widening status:
--   a stronger parametric algebraic regime-invariance theorem is now
--   exported above the current transport-invariance layer,
--   a recovered-wave-geometry theorem is now exported above the current
--   recovered-wavefront layer,
--   a wave-geometry-facing downstream consumer is now exported on the
--   canonical ladder,
--   and a moonshine twined-wave family summary is now exported on the
--   parallel finite graded/twined track.
-- Current newest cycle widening status:
--   a stronger parametric algebraic regime-persistence theorem is now
--   exported above the current regime-invariance layer,
--   a recovered-wave-regime theorem is now exported above the current
--   recovered-wave-geometry layer,
```

```
--   a wave-regime-facing downstream consumer is now exported on the
--   canonical ladder,
--   and a moonshine twined-wave-regime summary is now exported on the
--   parallel finite graded/twined track.
